About

I am a third-year Ph.D. student at the School of Information Science and Technology, [ShanghaiTech University](#), advised by Prof. Yuexin Ma. Previously, I obtained my B.S. degree from ShanghaiTech University in 2023.

My research lies at the intersection of **3D Computer Vision**, **Robotics**, and **Embodied AI**. My primary goal is to enable intelligent agents (like humanoid robots) to perceive, understand, and interact with the complex, dynamic 3D world in a human-like manner. I am particularly interested in **multi-modal sensor fusion (LiDAR-Camera)**, **3D human pose and motion understanding**, and building **human-in-the-loop systems** for bidirectional learning in human-robot interaction.

Patent 2025

General-purpose Dynamic Point Cloud Understanding Model and Multi-task Collaborative Optimization System

Publication No. CN120412083A

This invention discloses a general-purpose dynamic point cloud understanding model with a multi-task collaborative optimization system featuring a human-knowledge branch and a local-detail branch. It advances multi-level feature fusion for 3D human point clouds, optimizes dynamic temporal sequence modeling, and improves cross-task generalization. Applicable to intelligent surveillance, VR/AR, human-robot interaction, autonomous driving, and sports analytics, providing core algorithms for real-time, precise understanding of human behavior and state.
